Noran Engineering, Inc. new CAD integrated NEiWorks™, a Nastran finite element analysis (FEA) product embedded in SolidWorks® 3D mechanical design software, has been admitted to the SolidWorks Solution Partner program. The designation is used by SolidWorks Corporation to identify software products that pass specific criteria for customer acceptance and entitle it to corporate marketing support programs.

NEiWorks cost and ease-of-use gives companies access to the same Nastran FEA tools that are used by the leading industry practitioners in aerospace, automotive and maritime. Conversely, for many long time Nastran FE analysts in major corporations, NEiWorks' demonstration of a powerful geometry engine simplifying FE model creation will highlight many of the limiting aspects of conventional Pre/Post Processing. Moreover, NEiWorks' ability to share data with all Nastran users, like NEi, MSC or NX, will have an appeal to companies of all sizes.

NEiWorks has received recognition from NASA Tech Briefs magazine in its Product of the Year competition, along with Desktop Engineering magazine Editor's Pick feature for technology to watch.
